fpu_divsqrt
Start
unpack, special cases,
exponent: ea - eb (div)
or (ea - 127) / 2 (sqrt)
partial remainder rem
q (quotient / root)
Trial subtract
div: rem - divisor
sqrt: rem:2 bits - (4q + 1)
not negative: bit = 1
one bit per cycle:
27 steps for divide (24 bits + guard,
round and a normalisation bit),
26 steps for square root
fpu_round
sticky = rem != 0
result, flags
